

The "Infinite" Dice Roller (Control Flow & Modules)

The Hook: Build a game engine that uses the `random` module but with a twist—the "Else" clause on loops.

- **The Task:** Create a loop that rolls a virtual 6-sided die.
 1. If the user rolls a `6`, use `break` to exit and win.
 2. Use the `else` clause on the `while` loop to print "Game Over: You ran out of rolls!" if the loop finishes without hitting a 6.
 3. Track all rolls in a `List` and use `dir(list)` in your console to find a method to sort them before printing.

Scenario	Logic	Expected Output
Roll is 6	<code>break</code> triggered	"You won! Rolls: [x, y, 6]"
5 rolls, no 6	Loop finishes	"Game Over: You ran out of rolls!"
First roll 6	Immediate break	"You won! Rolls: [6]"
